

# How to have a BEAUTIFUL & ORGANIC LAWN

Thank you for choosing Good Nature, the healthier choice for your lawn, family and our environment. To have a healthy lawn you need 3 things: healthy soil, good grass varieties and good cultural practices (mowing, watering, and feeding). Below is our evaluation of your current lawn conditions. Let's connect soon to discuss what we noticed and make sure we're providing you with the right services to meet your expectations.

Going Organic does require a slightly different mindset and approach. Rather than treating symptoms (killing everything with chemicals as traditional lawncare companies do), we work to understand the root cause of any issue that might bother you, and then fix the real problem.

Over the next few pages, you'll find information about what we've noticed in your lawn. We'll use this information to formulate a plan that will gradually improve your lawn and landscape, without constant chemical treatments. We'll be in touch to discuss the next steps towards achieving a beautiful yard. Thanks again for going organic with Good Nature!

## GRASS CONDITION

### Bare Areas - A Few

We noticed a few bare spots in your lawn that could benefit from a little seeding. If you want to prevent weeds from sprouting in those areas you might want to loosen up the ground and put down some grass seed or contact us about other seeding options.

### Lawn Color - Fair

Your lawn color is about normal for this time of year.

## SOIL QUALITY

### Overall Soil Quality - Good

Overall your soil quality appears pretty good. It's difficult to assess nutrient levels without a soil test, but our judgement is that soil quality is probably not the limiting factor keeping you from having a nice lawn.

## CULTURAL ISSUES

## YARD CONDITIONS

## PERRENIAL WEEDS

### Broadleaf Plantain - Moderate

We noticed a moderate amount of broadleaf plantain in your lawn. Plantain is a perennial weed that indicates your soil is compacted. You can use a Speedy Weedy to remove it or you can try our Natural Weed Buster to weaken it. If you're really unhappy with it we can apply a spot chemical weed control treatment in the spring or fall at your request. Just killing the plantain with a chemical won't solve the underlying problem, soil compaction. We recommend Core and/or Liquid Aeration along with a compost topdressing.

### Dandelions - A Few

Your lawn has a few dandelions, which are not a problem at all unless they bother you. Dandelions actually improve your soil, but if you don't like dandelions, try an additional Natural Weed Buster treatment or pull them with our handy Speedy Weedy to reduce their number. If they really bother you, we can apply a seasonal spot chemical weed control treatment at your request.

## ANNUAL WEEDS

## DISEASES

### Brown Patch - A Little

Your lawn has a mild case of Brown Patch, a fungus that causes brown patches during hot weather. Today's application will help the lawn recover. To keep it from getting worse, don't water more than twice a week. Water deeply every 3 to 4 days. Water only in the morning - wetness on the blades at night can make the brown patch worse!

## PESTS

# RECOMMENDATIONS

## Recommend Soil Booster

We recommend an Organic Soil Booster for your lawn. Adding organic matter to your lawn will help increase the soil biology which in turn will help increase the health of your lawn. A healthier lawn will not only look better but will increase the lawn’s ability to combat lawn disease.

---

## YOUR LAWN SUMMARY

---

Good morning, Russ. Today I came out to do your lawn consultation assessment as well as your scheduled fertilizer application. I took a few photos for our team to look over, and these are some of the things I found. I took a soil sample from your yard and there are no signs of thatch issues. There are a few weed issues in the front yard, such as dandelion, thistle, and birdsfoot trefoil in the treelawn. An organic weed treatment could help to clear these up and prevent future germination. There are some bare areas in the backyard with mild lawn disease, and I would recommend an organic soil booster as well as seeding the bare areas in order to restore the grass and bring continuity to the lawn. I will pass this information along to the office, and we will work together in finding the best solution to keep your lawn organic and beautiful. We look forward to speaking with you soon. Thank you and have a great rest of your day!
